

## Ear care in chrome? Its so last century!

The trend from the use of metal ear syringes and towards the use of a pulsed water jet system continues. Ear care experts and trainers agree that the gentle yet efficient benefits of the pulsed water system far outweigh the increasingly outmoded chrome syringe of yesterday.

But it is not just the educators that are turning the tide against the chrome ear syringe – patients may be requesting it, too. According to one RNID patient fact sheet: “Ear syringing should be carried out with a pulsed water-jet system using a narrow tube connected to an electric pump, particularly the first time your ears are syringed.” Furthermore, the experts go on to suggest that: “If the doctor is going to use a metal syringe, you should say quite firmly that you want them to use the pulsed water-jet system. You should also feel free to get a second opinion.”

Mirage, manufacture of the UK’s favourite electronic ear irrigator have recently launched the Propulse III Universal, which is now fully portable and quieter than ever. The system also features a variable pressure control system, 10 Propulse Disposable ‘One Use’ Jet Tips and 10 Propulse Cleaning Tablets to prevent cross infection. The system is fully compliant with EC safety standards and comes with user manual, power adaptor, footswitch for hands-free control plus 12 months parts and labour warranty.

See for yourself why the Propulse is the country’s favourite electronic ear irrigator and how the Propulse III Universal is set to take electronic ear irrigation into the 21st century.
